Cloud Collaboration Security & Compliance

## ClearedIn for Microsoft Teams

Organizations are moving to Microsoft Teams to foster stronger collaboration, faster and more efficient communications, and to connect more meaningfully with their customers and partners. Security and compliance are two of the biggest concerns they have before embracing Slack to its fullest potential.

ClearedIn gives you a powerful security and compliance layer to unleash Teams' full potential while keeping your users and company safe. Clearedin helps users understand exactly who they're collaborating with and scans communication for dangerous or inappropriate links or content. You get real-time visibility into threats and because ClearedIn is deeply integrated into Microsoft 365, you get threat defense against Email, Teams, OneDrive, and SharePoint unified in one platform.

Key Capabilities

- Provide a real-time risk score on each new user that joins a channel

- Scan links, including redirects, and alert users on dangerous content

- Monitor and alert for credentials, PII, and other sensitive data

- Alert and Remediate if files are inappropriately shared

- Threat hunt across all Microsoft 365 channels including Email and OneDrive
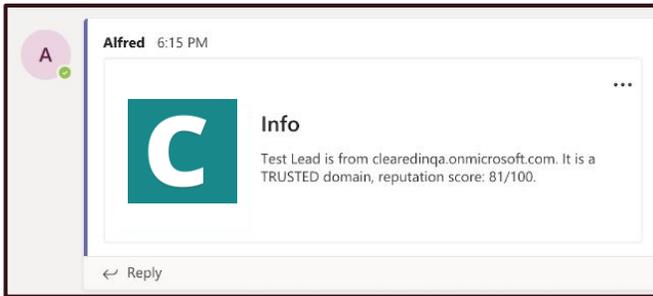

Clearedin

Guest and External Access are a key Teams capability but dealing with outside parties means exposing yourself to risk from external attack.

ClearedIn monitors your Teams and channels in real-time. As new users join your channels, ClearedIn calculates their risk score based on our patented Identity Trust Graph and warns your employees if the user is untrusted.

Phishing is not just an email threat. The same tactics that can be used on email can be used on any other channel including Teams.

ClearedIn monitors your domain-wide Teams and channels in real-time. It detects dangerous links, even if they are masked through URL shorteners and redirects. Your employees get a clear alert about where the link will take them and why it is dangerous.
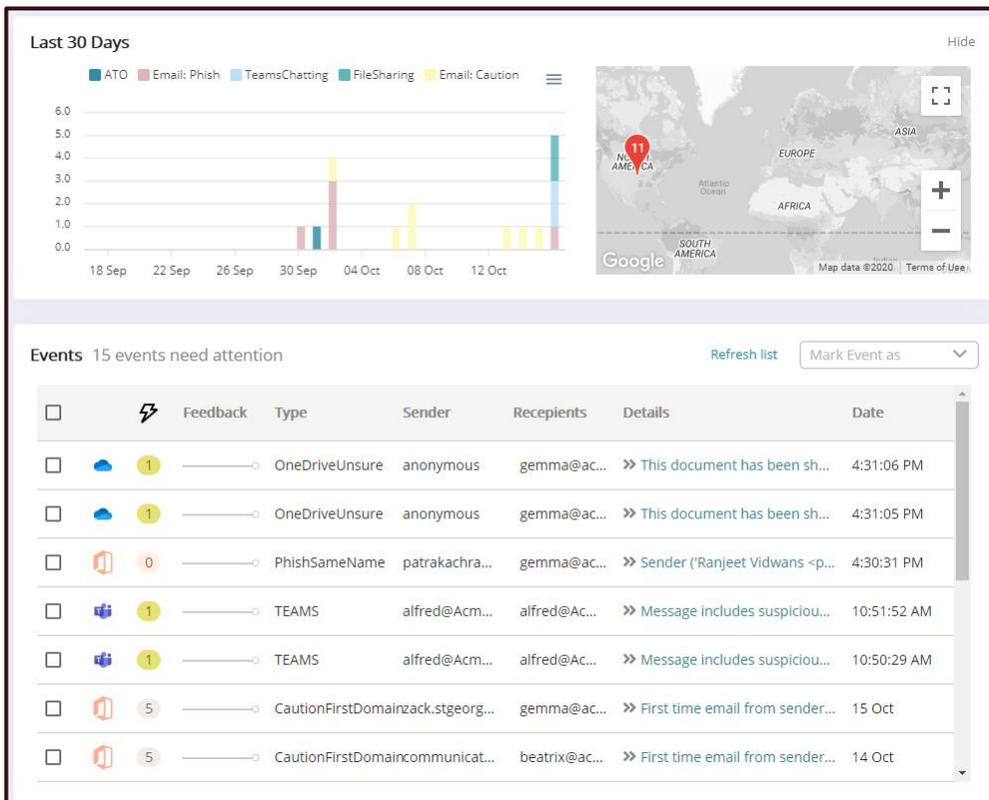

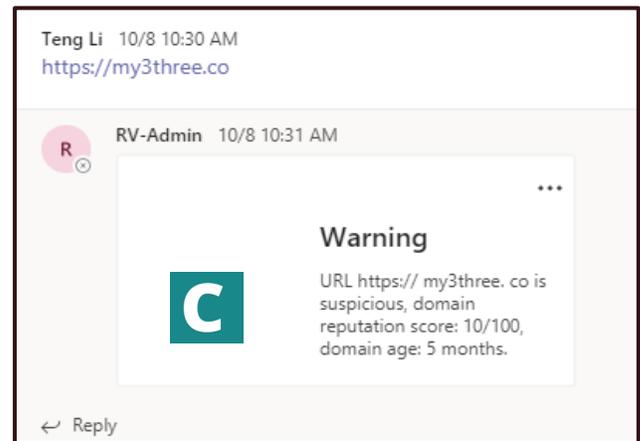

In addition to protecting your users, ClearedIn gives your admins and SOC analysts get a real-time view into security incidents being detected across all your Teams and other Microsoft 365 collaboration channels including Email, SharePoint, and OneDrive.

This unified view into security incidents across your Microsoft 365 environment arms your SOC with unprecedented visibility and threat-hunting tools to identify, correlate, and remediate attacks before they have a chance to take root in your organization.
